**PROGRAMME SPECIFICATION**

1. **Awarding Institution**: Newcastle University
2. **Teaching Institution**: Newcastle University
3. **Final Award**: MSc (Hons)
4. **Programme Title**: Geotechnical Engineering
   Applied Geotechnical Engineering and
   Geological Science (exit award)
5. **UCAS/Programme Code**: 5042F/P
   5420P
   5473F (exit award)
6. **Programme Accreditation**: JBM
7. **QAA Subject Benchmark(s)**: Engineering
8. **FHEQ Level**: 7
9. **Last updated**: May 2023

### 10 Programme Aims

1. The primary purpose of this programme is to provide graduate civil engineers and geoscientists with advanced conceptual understanding, detailed factual knowledge, and specialist technical skills appropriate for a successful career as a geotechnical engineer in the construction, mineral extraction and/or environmental industries.

2. The programme is also designed to be capable of taking graduates of other numerate disciplines, such as geophysics, engineering, physics and mathematics, and converting them into skilled geotechnical engineers. To this end, the programme addresses:
   
   (i) the principles of geotechnical engineering, and their application in a range of contexts (including civil engineering, mineral extraction and environmental)
   
   (ii) soils and rocks and their engineering properties
   
   (iii) the site investigation, testing, interpretation and reporting process
   
   (iv) key aspects of geotechnical design, e.g. foundations, slopes, retaining walls
   
   (v) the application of mathematical methods and computational tools in geotechnical engineering

3. In addition to these academic and technical skills, the programme also aims to equip its graduates with a suite of transferable skills, including the ability to communicate effectively, the ability to employ IT and library resources appropriately, the ability to prioritise work and to meet deadlines, the ability to work alone and with others, and the ability to use initiative and to solve problems.

4. To provide a programme that meets the accreditation requirements of the Joint Board of Moderators (JBM [www.jbm.org.uk](http://www.jbm.org.uk)) for Further Learning for a Chartered Engineer (CEng) for candidates who have already acquired an Accredited CEng (Partial) BEng(Hons) or an Accredited IEng (Full) BEng/BSc (Hons) undergraduate first degree.

5. To provide a programme designed to meets the standards set by the Engineering Council’s Accreditation of Higher Education Programmes (AHEP3, May 2014).

6. To provide a programme that develops the skills, attributes and values defined in the University’s Graduate Skills Framework.
Programme Learning Objectives

On successful completion of the programme, students will have acquired a much deeper knowledge and understanding of Geotechnical Engineering than would be expected at undergraduate level, together with many new skills.

Specifically, students will have gained:

- An advanced knowledge and understanding of the principles of Geotechnical Engineering and of their applications in a civil engineering context
- An advanced knowledge and understanding of the engineering properties and characteristics of soils and rocks
- An advanced knowledge and understanding of the site investigation process from design, through testing and interpretation, to reporting
- An advanced knowledge and understanding of the geotechnical design process, and of the design of foundations, slopes and retaining walls
- A knowledge and understanding of the application of appropriate mathematical methods and IT tools, in Geotechnical Engineering
- A knowledge and understanding of construction practice and an awareness of requirements for safe operation.
- The ability to identify the geological data relevant to a given engineering scenario, generate such data from field observation or through the employment of appropriate laboratory testing techniques, and interpret these data in an engineering context
- The ability to skilfully employ appropriate numerical methods for modelling and analysing problems in Geotechnical Engineering
- The ability to select and apply ideas, concepts and data, from both science and engineering, in order to generate creative and innovative designs which provide optimal solutions to geotechnical problems
- The ability to skilfully employ appropriate software to support the design of these solutions
- The ability to evaluate the quality of engineering geological data collected through the use of testing and measurement equipment in field and laboratory environments
- The ability to present and summarise such data, and to critically appraise its significance, using numerical techniques
- The ability to critically assess the value and limitations of existing information on a given subject
- The ability to formulate or recognise key hypotheses, to test hypotheses using logical and consistent quantitative or qualitative arguments, and to identify key data which allow such tests to be made
- The ability to critically assess the value and limitations of new data in relation to existing information on a given subject, to draw logical conclusions, and to identify appropriate avenues for further study
- The ability to solve problems
- The ability to communicate by means of well prepared, clear and confident presentations and concise and grammatical written documents
- The ability to use library and other information sources skilfully and appropriately
- The ability to use IT resources skilfully and appropriately
- The ability to plan, organise and prioritise work activities in order to meet deadlines
- The ability to work independently, with initiative, and also in teams

11 Learning Outcomes

The programme provides opportunities for students to develop and demonstrate knowledge and understanding, qualities, skills and other attributes in the following areas. The programme outcomes have references to the benchmark statements for Engineering.
### Knowledge and Understanding

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A1</strong></td>
<td>An advanced knowledge and understanding of the principles of geotechnical engineering and their applications in a civil engineering, environmental and extractive industries context</td>
</tr>
<tr>
<td><strong>A2</strong></td>
<td>An advanced knowledge and understanding of the engineering properties and characteristics of soils and rocks</td>
</tr>
<tr>
<td><strong>A3</strong></td>
<td>An advanced knowledge and understanding of the application of mathematical methods in geotechnical engineering</td>
</tr>
<tr>
<td><strong>A4</strong></td>
<td>A knowledge and understanding of aspects of construction practice and an awareness of requirements for safe operation.</td>
</tr>
<tr>
<td><strong>A5</strong></td>
<td>A knowledge and understanding of the application of geotechnical design processes in specific site developments</td>
</tr>
<tr>
<td><strong>A6</strong></td>
<td>A knowledge and understanding of the applications of computational methods in geotechnical engineering</td>
</tr>
</tbody>
</table>

### Teaching and Learning Methods

Specialist technical knowledge and understanding (A1-A6) are primarily imparted through lecture classes, many of which involve lecturers from industry. Lectures are supported by a range of field trips and site visits (A1-A2), tutorials (A2, A3, A4 A6), laboratory and other practical activities (A2, A4), and coursework projects (A3-A6).

Throughout the taught component of the course, students are encouraged and expected to engage in independent reading, and are supported in this by the provision of individual module reading lists. Observations and discussions on field trips and site visits (A1-A2), active participation in tutorials and practical classes (A2, A4) and engagement in coursework projects (A3-A6) all assist in the development of understanding.

### Assessment Strategy

Formative assessment occurs through tutorial examples and coursework. For summative purposes, unseen examinations and project-based coursework are employed to assess factual knowledge and understanding.

Coursework involves both written and oral presentations. Some, or all, of A1-A6 (depending on topic) are also examined by means of a dissertation and presentation.

### Intellectual Skills

<tbody>
<tr>
<td><strong>B1</strong></td>
<td>Select and apply appropriate mathematical methods for modelling and analysing problems in geotechnical engineering</td>
</tr>
<tr>
<td><strong>B2</strong></td>
<td>Select and develop appropriate computer based methods for modelling and analysis of problems</td>
</tr>
<tr>
<td><strong>B3</strong></td>
<td>Use scientific principles to demonstrate creative and innovative ability in the syntheses of solutions and in formulating designs for remediation of geotechnical problems</td>
</tr>
<tr>
<td><strong>B4</strong></td>
<td>Use scientific principles in the modelling and analysis of systems and processes of importance to the geotechnical engineer</td>
</tr>
<tr>
<td><strong>B5</strong></td>
<td>Produce solutions to problems through the application of engineering knowledge and understanding</td>
</tr>
<tr>
<td><strong>B6</strong></td>
<td>Undertake technical risk evaluation.</td>
</tr>
</tbody>
</table>

### Teaching and Learning Methods

Understanding and experience of the analytical and testing techniques used in geotechnical engineering (B1), are provided in the lectures, laboratory and other practical classes of modules. Numerical skills (B1, B2) are formally taught in lectures and computer-based practical classes, and are practised in design exercises.
Students are encouraged to acquire skills B1 and B2 through reflection on lectures, and active participation in the laboratory, and other practical classes. Lectures and design exercises allow students first to acquire, and then practise, their design skills (B3, B4). Familiarity with B1-B5 is reinforced, and further developed, as students apply their new skills to the analysis and solution of real problems.

**Assessment Strategy**

Subject specific and practical skills (B1-B5) are assessed by means of coursework exercises (e.g. calculations, design exercises, technical reports) and by unseen written examination. Some, or all, of B1-B5 (depending on topic) are also examined by means of a dissertation and presentation.

**Practical Skills**

On completing the programme students should be able to:

C1 Evaluate the quality of geotechnical data collected through the use of testing and measurement equipment in field and laboratory environments

C2 Present and summarise such data, and to appraise critically its significance, using numerical techniques

C3 Critically assess the value and limitations of existing information on a given subject

C4 Formulate or recognise key hypotheses, to test hypotheses using logical and consistent quantitative or qualitative arguments, and to identify key data which allow such tests to be made

C5 Critically assess the value and limitations of new data in relation to existing information on a given subject, to draw logical conclusions, and to identify appropriate avenues for further study

C6 Use engineering IT tools where appropriate

C7 Solve problems

**Teaching and Learning Methods**

Practical skills C1-C7 are developed during laboratory sessions, site investigation and design exercises and are also addressed within the individual student dissertation, whilst tutorials, field exercises and attendance at School research seminars enable skills C3-C7 to be developed further.

**Assessment Strategy**

Practical skills (C1-C6) are assessed by means of coursework in the form of site investigations, laboratory classes and reports, and written examinations. Some, or all, of C1-C6 (depending on topic) are also examined by means of a dissertation and presentation. C7 is primarily assessed through both coursework design reports and a dissertation.

**Transferable/Key Skills**

On completing the programme students should be able to:

D1 Communicate by means of well prepared, clear and confident presentations and concise and grammatical written documents

D2 Retrieve information from literature/databases and manipulate and present data in a variety of ways

D3 Efficiently use general IT skills

D4 To plan, organise and prioritise work activities in order to meet deadlines

D5 To work independently, with initiative, and also in teams as required.

D6 Be creative and innovative in problem solving

**Teaching and Learning Methods**

Key skills D1-D4 are formally taught as part of the individual dissertation while opportunities may also be provided to develop all of these skills. Management of workload
in order to meet deadlines (D4) is also promoted by means of coursework deadlines, whilst team working skills (D5) are developed by group exercises. These also provide opportunities for students to improve their problem-solving abilities (D6), and to extend their communication, library, IT, and time management skills (D1-D4).

**Assessment Strategy**

Key skills (D1-D4) are assessed via written examinations, the production of a research brief, and presentations. Communication (D1), library (D2) and IT (D3) skills, and the ability to meet deadlines (D4) work independently (D5) and solve problems (D6) are indirectly assessed by other coursework items (e.g. map exercises, technical reports, design projects), and all key skills (D1-D6) are examined by means of a project dissertation.

### Programme Curriculum, Structure and Features

#### Basic structure of the programme

This is a one-year full-time modular programme. It consists of 100 credits of compulsory, technical modules, 20 credits of optional modules and a 60 credit Dissertation. The taught component runs from late September to Easter, with the Dissertation submitted in August. Successful completion of the taught component is required in order for a student to progress to the Dissertation. All modules are taught in two week blocks (= 10 credits) or three/four weeks (= 20 credits) allowing students to become deeply immersed in a subject, and facilitating part-time study by students abroad or in industry.

#### Key features of the programme (including what makes the programme distinctive)

This is a one-year full-time modular programme. It consists of two parts: a 120-credit taught component, which runs from late September until June, and a 60-credit research project, for which a dissertation is submitted in August. Successful completion of the taught component is required in order for a student to progress to the dissertation project.

Following induction, and introductory sessions, the technical modules which make up the taught component of this programme lead the student sequentially and logically from the principles of geotechnical engineering through to its applications, and complete the conversion of relatively inexperienced graduates into competent consultants. The technical content of the course is closely aligned with the research interests of the staff, enabling the modules to include cutting edge material which is constantly updated.

The optional overseas residential Field Trip at the end of Semester 2 allows the content of the technical modules to be applied and explored in the context of a wide range of exemplar sites.

The taught component of the Dissertation introduces the generic skills required in order to successfully initiate, carry out, and report on a significant research project and provides training in the use of appropriate statistics for data analysis and interpretation. With the guidance of the project supervisor each student will practice and develop the majority of the key skills in the course of their dissertation. Dissertations are closely aligned to the research interests of the Group and School, and may have input from industry research collaborators.

Research projects are often laboratory based, but may also involve field studies or numerical modelling work. During the project, students are usually based in the School, perhaps working in one of our established research groups, but the dissertation might entail working elsewhere, in collaboration with another industrial or academic partner. Students are encouraged and given support if they wish to seek publication of the results/findings of their dissertations.

Beyond the standard technical Geotechnical Engineering route opportunities are provided for students to optionally follow alternative broadening paths exploring aspects of climate
change and its relationship to Geotechnical Engineering practice or business, consultancy and entrepreneurial aspects of the Geotechnical Engineering.

The course is run by the ‘Geotechnical and Structural Engineering’ group in the School of Civil Engineering and Geosciences and is closely partnered with the sister MSc Engineering Geology course. Throughout the programme students will find themselves immersed in an environment combining students from civil engineering, geological and other scientific backgrounds and cross-pollination of academic training and experience is actively encouraged. Furthermore, combined expertise in geotechnics and structures enables advanced consideration of soil-structure interaction and seismic behaviour to be included.

An innovative feature of the course is that all technical modules are taught in short (generally one or two-week) blocks. These occupy students, largely full-time, until the module has been completed and students then progress to the next module. This structure enhances student learning by allowing later units to build on the concepts, knowledge and skills gained during those taught earlier and facilitates part-time study by students abroad or in industry.

Accreditation reports
The programme is accredited for further learning by the Joint Board of Moderators (Institution of Civil Engineers (ICE)), Institution of Structural Engineers (IStructE) and Institution of Highways and Transportation (IHT)). It is reviewed every 5 years following a visit from a JBM review panel made up of academics and professional engineers. The results and feedback from the JBM panel are considered by the Board of Studies.
