

**PROGRAMME SPECIFICATION**

<b>1</b>	<b>Awarding Institution</b>	Newcastle University
<b>2</b>	<b>Teaching Institution</b>	Newcastle University
<b>3</b>	<b>Final Award</b>	MSc
<b>4</b>	<b>Programme Title</b>	International Marine Environmental Consultancy MSc
<b>5</b>	<b>UCAS/Programme Code</b>	5158F/P (5158P is withdrawn from entry)
<b>6</b>	<b>Programme Accreditation</b>	IMarEst – for 5158F
<b>7</b>	<b>QAA Subject Benchmark(s)</b>	Environmental Studies (ES3) Biosciences
<b>8</b>	<b>FHEQ Level</b>	7
<b>9</b>	<b>Date written/revised</b>	September 2024

**10. Programme Aims**

The aim of this programme is to meet industry needs by launching competent, experienced marine consultants and coastal managers into UK, European and International business, to meet the growing demand for truly multidisciplinary graduates within the growing environmental sector.

1. To give students from a range of backgrounds a common level of knowledge and understanding of marine environmental issues around the world, and the assessment of these in a contemporary marine consultancy business context.
2. To enable such students to gain knowledge and understanding of the role of science, policy, technology and development in the marine environment.
3. To enable such students to gain knowledge and understanding of business principles and practice and the role of enterprise and to actively apply this knowledge to marine consultancy.
4. To provide students with an appreciation of the need for, and mechanisms to achieve, sustainability in the marine environment, and the role that environmental consultancy play in achieving this.
5. To enable students to understand the social, political and economic climate in which international marine environmental consultancies must work.
6. To produce high quality, multi- and inter-disciplinary graduates armed with business skills and hands-on consultancy experience, for the marine sector.
7. To provide a programme consistent with Level 7 of the FHEQ.

**11. Learning Outcomes**

1. Mastering an interdisciplinary approach to the study of marine consultancy that encompasses both landward (such as communities socio-economically dependent on marine resources) and seaward (for example, sustainable marine energy) concerns.
2. The principles, theory and practice of marine management
3. Knowledge of biodiversity, economic goods and services, physical and biological processes, developing technologies and function of coastal ecosystems that provide the resource base for communities in tropical and temperate regimes.
4. Understanding and use of social science methodologies to project appraisal and environmental management.
5. The role of governance in marine management focussing on advances in law and policy for addressing the development, management and use of coastal resources at local, national and international levels.
6. A broad portfolio of subject-specific knowledge and understanding related to marine consultancy, drawn from various modules on, coastal production systems, governance, marine research and evaluation, environmental impact assessment and research skills.

7. Applications of multi-disciplinary and interdisciplinary approaches to advancing marine consultancy, drawing as appropriate from the natural and social sciences and where possible, based on real life case studies.

### **Knowledge and Understanding**

The programme provides opportunities for students to develop and demonstrate knowledge and understanding, qualities, skills and other attributes in the following areas. The programme outcomes have references to the benchmark statements for Knowledge and Understanding.

1. On completing the programme students should have: Mastered an interdisciplinary approach to the study of coastal and marine environments around the world, gaining awareness of socio-economic as well as scientific and technical aspects of coastal and marine management.
2. Knowledge of biodiversity, economic goods and services, physical and biological processes, developing technologies and functions of coastal ecosystems and the resources that these provide in tropical and temperate regimes.
3. Understanding and use of both natural social/economic science methodologies to support project formulation and appraisal in support of environmental assessment and management, in a consultancy context.
4. Understanding of the role of governance in marine environmental issues, focussing on advances in law and policy for addressing the development, management and use of coastal resources at local, national and international levels, and the implications of these for environmental consultancy in the marine environment.
5. A broad portfolio of subject-specific knowledge and understanding related to marine environmental consultancy, drawn from various modules on coastal production systems, coastal governance policy and management, marine resource mapping and evaluation, environmental impact assessment and marine environmental research skills.
6. Applications of multi-disciplinary and inter-disciplinary approaches to marine consultancy, drawing as appropriate from the natural and social sciences and where possible, based on real life case studies from around the world.
7. An understanding of the principles of environmental consultancy and be aware of both common tools and new developments employed in the industry in different countries.
8. An understanding of the economic, social and political climate in which the environmental consultancy industry must work.
9. An understanding of the life cycle of a business from set up to liquidation including business plans, and the nature of enterprise.
10. An understanding of the principles of project planning and management and the ability to apply these to small scale consultancy projects.

- A1. Appreciated interdisciplinary approaches to the study of integrated coastal management that encompasses both landward (e.g. communities socio-economically dependent on marine resources) and seaward (e.g. sustainable ecosystem exploitation) concerns.
- A2. Grasped the principles, theory and practice of integrated coastal management.
- A3. Gained knowledge of biodiversity, economic goods and services, physical and biological processes, developing technologies and functions of coastal ecosystems that provide the resource base for coastal communities.
- A4. Increased understanding and ability to use social science methodologies for project appraisal and environmental management.
- A5. Comprehended roles of governance in coastal management focussing on advances in law and policy for addressing the development, management and use of coastal resources at local, national and international levels.
- A6. Gained a broad portfolio of subject-specific knowledge and understanding related to coastal management, drawn from modules on coastal production systems, governance, marine environmental research, and environmental impact assessment.
- A7. Applications of multi-disciplinary and inter-disciplinary approaches to advancing tropical coastal management, drawing as appropriate from the natural and social sciences and where possible, based on real life case studies.

### **Teaching and Learning Methods**

Knowledge and understanding (A1-A7) are developed mainly through lectures/seminars/tutorials/fieldwork, case-histories, case studies and development and practice of research skills. A3 is further developed in a scientific literature study in which learning is reviewed by peer assessment, formative and summative assessment. A1 to A7 are supplemented by active participatory exercises involving role-playing, seminars, teamwork and communication to solve problems and facilitate learning by experience. A6 is initially developed through hands-on experience in the first instance through fieldwork studying both inter and sub-tidal habitats, based on the rocky shore and RV Princess Royal respectively. It is subsequently then facilitated by internal and external staff through core and optional modules using a variety of methods including lectures, participatory exercises, interactive seminars, guided self-study and workshops. A reflective learning logbook allows students to consider the wider relevance of their learning in the workplace (A7).

#### **Assessment Strategy**

Knowledge and understanding (A1 to A7) is summatively assessed by unseen written examination and written reports, including the literature review as part of the research project. Formative assessment is by individual tutoring, feedback on written work (at various stages) and individual and group feedback in participatory exercises and case studies.

#### **Intellectual Skills**

On completing the programme students should have:

1. Awareness of, ability to identify, access and make critical use of sources of information on the economic, environmental, legal, political, social, scientific, technological and other aspects of coastal management; integrating and evaluating information and data from a variety of sources.
2. Skills in practical marine survey, data exploration, numerical analysis and application of statistical methods to field, survey and experimental data related to coastal management, with the ability to make decisions from data, interpret published results in a meaningful way and formulate useful inferences.
3. The ability to design, plan (including contingency planning) and execute independent marine environmental consultancy studies, based either at the desk or in the field. Including the selection and application of appropriate mathematical and computer based methods for modelling and analysing relevant problems, as required.
4. The ability to take a creative holistic approach to solving problems, applying professional judgements to balance risks, costs, benefits, safety, reliability, aesthetics and environmental impact, with the experience required to identify suitable analytical and assessment methods for solutions to consultancy challenges, working with relevant financial constraints and legislative frameworks.
5. Synthesis and presentation of data and ability to produce professional quality reports suitable for international, national and local consultancies and their clients, particularly government agencies.
6. Dissemination of key information and communication with specialists and/or non-specialists on a range of coastal and marine issues of relevance to consultancy.
7. A thorough understanding of the business and enterprise aspects of environmental consultancy and the range and diversity of consultancy specialist markets that operate within the marine sector.

The ability to formulate competitive project plans, tender documents and business plans for the marine consultancy sectors, applying general principles to specific consultancy situations.

On completing the programme students should be:

- B1. Aware of and able to identify, access and make critical use of sources of information on the economic, environmental, legal, political, social, scientific, technology and other aspects of coastal management.
- B2. Capable of data exploration, numerical analysis and application of statistical methods to field, survey and experimental data related to coastal management – ability to make

<p>decisions from data, interpret published results in a meaningful way and formulate useful inferences.</p> <p>B3. Able to design, plan (including contingency planning) and execute independent field studies, both shore and boat based, with coastal management applications.</p> <p>B4. Able to synthesise and present data and able to produce professional quality reports suitable for international, national and local agencies.</p> <p>B5. Capable of dissemination key information and communication with specialists and/or non-specialists on a range of coastal issues.</p>
<b>Teaching and Learning Methods</b>
<p>Subject specific skills B1 and B2 are introduced, applied and reinforced in several modules allowing practical applications to be learned and practiced in different situations. B3 and B4 are introduced through case studies and research project proposals and developed in the final consultancy project, which is individually supervised before and after the research proposal has been evaluated and approved. B is demonstrated in a number of modules and applied in fieldwork. A number of modules develop aspects of experimental and survey design and report preparation as part of lectures/seminars, case studies and group-led field exercises.</p>
<b>Assessment Strategy</b>
<p>Subject-specific skills (B1 and B2) are assessed by practical reports, essays and literature reviews. B3 and B4 are mainly assessed as part of the research project, including separate evaluations of the study plan, literature review and research paper. Aspects of experiment/survey design and presentation (B3 and B4) are also assessed in optional modules by practical reports and literatures reviews. B5 is assessed through a number of modules including the research project.</p>
<b>Practical Skills</b>
<p>On completing the programme students should be able to:</p> <p>C1. Synthesise, summarise and integrate existing information and critically assess different sources of information.</p> <p>C2. Collect new data and information and incorporate with existing knowledge – present this information in different formats to make clear to those targeted.</p> <p>C3. Design and implement information-gathering strategies in an efficient and cost-effective way.</p> <p>C4. Apply knowledge and understanding of coastal management to familiar and unfamiliar problems such as identifying and resolving stakeholder conflicts.</p>
<b>Cognitive Skills</b>
<p>1. Synthesise, summarise and integrate existing information and critically assess different sources of information.</p> <p>2. Collect new data and information and incorporate with existing knowledge – present this information in different formats to make clear to those targeted.</p> <p>3. Design and implement information-gathering strategies in an efficient and cost-effective way.</p> <p>4. Critically appraise assessment methodologies within a commercial consultancy environment.</p> <p>5. Critically evaluation tools and techniques based on financial as well as technical merit; employing good professional judgement to balance risks, costs and benefits.</p> <p>6. Apply knowledge and understanding of the marine environment to familiar and unfamiliar problems, such as identifying and resolving stakeholder conflicts or balancing commercial and environmental priorities for clients.</p>
<b>Teaching and Learning Methods</b>
<p>These skills are challenged through literature views (C1) introduced at the start of the programme and form a major part of the research project. C2 and C3 are developed in the research project, during field exercises and in several optional modules with data gathering and data mining exercise. Students develop cognitive skills (C4) through problem-solving exercises and case studies from real-life environmental projects.</p>
<b>Assessment Strategy</b>
<p>Synthesis, critical use and understanding of information (C1) is assessed by written reports of independent exercises including the research project. C2 and C3 are assessed by written reports in the research project and one other compulsory module. C4 is assessed by practical and case study reports and the reflective learning logbook.</p>

<b>Transferable/Key Skills</b>
<ol style="list-style-type: none"> <li>1. Effective verbal and written communication appropriate to the intended audience.</li> <li>2. Numerical skills, including survey and experimental design, data collection, data handling, analysis and presentation using a range of packages.</li> <li>3. Analytical skills – including policy and legal analysis, spatial planning and analysis.</li> <li>4. Critical and effective use of IT including internet resources, reference managers and other software packages as a means of communication and source of information.</li> <li>5. Independent study skills, self-organisation and time-management.</li> <li>6. Teamwork and interpersonal skills, including identifying individual and collective goals and responsibilities, managing meeting and schedules, recognising and respecting the views of others, conflict resolution and building consensus.</li> </ol> <p>Project design, resourcing and budgeting skills, understanding of business and enterprise.</p> <p>On completing the programme students should:</p> <ol style="list-style-type: none"> <li>D1. Have effective verbal and written communication appropriate to the intended audience.</li> <li>D2. Be able to use numerical skills, including survey and experimental design, data collection, data handling, analysis and presentation using a range of packages.</li> <li>D3. Be capable of making critical and effective use of IT including internet resources, reference managers and other software packages as a means of communication and source of information.</li> <li>D4. Possess independent study skills, self-organisation and time management.</li> <li>D5. Have teamwork and interpersonal skills, including identification of individual and collective goals and responsibilities, management of meetings and schedules, recognition and respect for the views of others, conflict resolution and building consensus.</li> </ol>
<b>Teaching and Learning Methods</b>
<p>Key skills (D1 to D5) are introduced in the Marine Environmental Research Skills module via hands-on exercises and accompanying workbooks. The application of these skills is also assessed in a variety of modules, different situations and intended audiences. Numerical skills (D2) are developed using a series of exercises. Independent study (D4) is promoted in library research projects and the final research project, whereas teamwork (D5) is practiced in independent group exercises in several modules.</p>
<b>Assessment Strategy</b>
<p>Communication skills (D1) are assessed by oral presentations and written reports in a number of modules. Numerical, IT and independent study skills (D2 to D4) are assessed by practical reports, literature reviews and the research paper. Teamwork skills (D5) are assessed by individual reports on group work and by group reports supplemented by <i>viva voce</i> assessment of organisation and interpersonal skills.</p>

<b>12 Programme Curriculum, Structure and Features</b>
<b>Basic structure of the programme</b>
<p>The MSc is normally one year programmes, consisting of modules totalling 180 and 120 credits worth of study respectively. Taught modules provide structured learning over 22 weeks from September to March.. A core of three 20-credit compulsory modules are taken by all Ecology and Environment PGT programmes in SNES. This ensures that all students across the school have a solid foundation in both the quantitative and qualitative skills that are essential in modern ecological science. Two of these modules will be taught in Semester 1, so that students benefit from peer-support, and all reach a similar high technical standard before diverging into the different individual degree programmes. At the discretion of the Degree Programme Director and within timetabling constraints, students can substitute other modules from throughout the University for semester two modules. The MSc has an additional Consultancy project carries a value of 60 credits. See Annex for list of modules and specific knowledge, understanding and skills outcomes.</p> <p>The aim of the programme is to provide existing professionals and graduates with a flexible training programme leading to recognised postgraduate and professional qualifications,</p>

while facilitating increased levels of interaction between Newcastle University, commercial companies, professional bodies and other organisations operating across the marine sector, nationally and internationally.

To achieve this it will capitalise upon the excellent array of discipline based science and engineering masters level courses already available within the university, developing additional new material only to provide the interdisciplinary linkages to deliver successful IMEC graduates with the necessary holistic approach. In addition, core governance, legal, policy and management components are augmented by more taught consultancy, business planning and enterprise aspects.

Alongside specific existing enterprise and entrepreneurship modules there is an intensive 'consultancy' module. This involves two taught weeks of seminars in semester 2, delivered by partner organisations, describing 4 month consultancy projects that each MSc student has a chance to work on in the final semester. Once topics and partner organisations are selected, students develop a marine project for assessment with the relevant UK/EU or International consultancy. This activity is focused on collaboration with regional, national and international businesses, and yields significant benefits, for the programme and school strategies for engagement.

**Key features of the programme (including what makes the programme distinctive)**

A distinguishing and defining feature of this MSc is that it is taught by a multi-disciplinary team that aims for and repeatedly adopts an interdisciplinary approach to integrated coastal management with due consideration given to economic, ecological and social aspects from both a landward and seaward viewpoint. It actively seeks commercial collaborations with local, UK/EU and International consultancies, stimulating marine science engagement and offering students unique opportunities to work with the best marine consultancies worldwide.
