

PROGRAMME SPECIFICATION

1	Awarding Institution	Newcastle University
2	Teaching Institution	Newcastle University
3	Final Award	BSc Hons
4	Programme Title	Marine Zoology Marine Zoology with Placement
5	UCAS/Programme Code	C350 1158U
6	Programme Accreditation	IMarEST – C350 only
7	QAA Subject Benchmark(s)	Organismal Biology Biosciences
8	FHEQ Level	6
9	Last updated	September 2024

10 Programme Aims

1. To enable everyone on the degree programme to develop a thorough knowledge and understanding of the natural history of marine organisms and both their zoological and ecological function within the marine ecosystem in the specialist areas of; (i) the biology and physiology of marine organisms; (ii) the evolution of both organisms and functional morphologies and (iii) the ecology of marine communities, together with appropriate research, practical and employability skills.
2. To be able to appreciate the application of this knowledge and understanding to the management of human activities.
3. To provide a Marine Zoology programme for well-motivated people from a diversity of social, geographic and academic backgrounds.
4. To provide an advanced curriculum enhanced by an active research environment that will encourage: thinking in a critical and constructive manner, awareness of new technologies and the skills and aptitudes needed for the development of a wide variety of careers within Marine Science and other areas of graduate employment.
5. To stimulate an informed interest in natural history, evolution and taxonomy and engender an awareness of its importance and its interaction with society and the environment.
6. To provide an environment within which everyone can enjoy their learning experience and develop the skills and attitudes to underpin lifelong learning.

For students on the Placement Year programme:

7. Provide students with the experience of seeking and securing a position with an employer.
8. Facilitate independent self-management and proactive interaction in a non-university setting.
9. Provide a period of practical work experience that will benefit current academic study and longer term career plans.
10. Enable students to ethically apply their knowledge and skills in the work place, reflect upon their development and effectively evidence and articulate their learning in relevant future settings.

11 Learning Outcomes

The programme provides opportunities for students to develop and demonstrate knowledge and understanding, qualities, skills and other attributes in the following areas. The programme outcomes have references to the benchmark statements for Marine Zoology.

Knowledge and Understanding

On completing the programme students should have, and be able to, demonstrate:

- A1 a coherent understanding of Marine Zoology, including a knowledge and understanding of
- (i) the biology of marine organisms,
 - (ii) the ecology of marine communities ,
 - (iii) the application of marine biological knowledge to applied industrial/technological scenarios and
 - (iv) the physical and chemical processes occurring in the marine environment.

- A2 a coherent understanding of the impact of human activities on marine organisms and the environment
- A3 a coherent understanding of the role of interdisciplinary marine science in the management and conservation of marine organisms and the environment.
- A4 an understanding of current developments in Marine Zoology and appreciate the possible implications
- A5 a coherent understanding of the process of data collection and analysis; sourcing scientific literature and producing an analytical review of new information from a range of sources
- A6 an understanding of cellular biochemical processes and how they relate to organismal life-history and molecular differentiation

For students on the Placement Year programme:

- A7 Apply personal and professional development strategies to prioritise, plan, and manage their own skills development and learning.
- A8 Research, select and apply relevant knowledge aimed at enhancing their own skills and effectiveness in specific duties at their placement.
- A9 Demonstrate an understanding of a work environment, how it functions and their contribution to it.
- A10 Relate their work based learning to other areas of personal development, including academic performance.

Teaching and Learning Methods

Knowledge and understanding (A1 – A4; A6) are principally imparted through lectures and seminars. Seminars and advanced lecture courses in Stage 3 are particularly important in delivering A4 as they provide the opportunity for exposure to knowledge at the 'cutting edge' of advancement in the field. Throughout the course students are directed to appropriate reading materials. The tutorial system and study skills classes provide support and guidance in the use of literature and the diversity of sources available. A number of 'self-study' packs, backed by tutorial support and seminars, are used to develop IT and statistical expertise (A5).

Assessment Strategy

Knowledge and understanding of the subject are primarily assessed through unseen written examinations to examine the breadth of factual knowledge. Assessed written tasks, essays and library projects are used to determine the ability to apply knowledge and integrate material. Formative feedback is provided throughout the course to allow students to assess and develop their learning skills.

Intellectual Skills

On completing the programme students should have developed skills in:

- B1 Sourcing, abstraction and synthesis of information from a range of media
- B2 Demonstrating academic rigour and the ability to propose, test and challenge hypotheses
- B3 Experimental design
- B4 Critical analysis and interpretation of data and text
- B5 Solving problems and making reasoned decisions

Teaching and Learning Methods

Cognitive skills are introduced at Stage 1(B1) and developed progressively throughout Stage 2 (B3-B5) to an advanced level in Stage 3 modules (B2). Group practical work and projects allow students to develop analytical skills supplemented by experimental design and data collection through practical classes, fieldwork and boat work. The Stage 3 research project and overseas field course promotes development of hypothesis testing and problem solving skills.

Assessment Strategy

Academic rigour and hypothesis development and testing are primarily assessed through coursework assessments associated with field, boat and laboratory practical exercises, the residential field course and ultimately the honours research project. Assessments range from written reports, short 'journal-style' articles, posters and computer based exercises. These determine ability to conduct research based exercises integrating knowledge and practical abilities. Experimental design, hypothesis testing and data analysis skills are further assessed through an unseen, open book written examination. Formative feedback is provided throughout the course to allow students to assess and develop their learning skills.

Practical Skills

On completing the programme students should be able to:

- C1 Plan, design and execute effective laboratory experiments and field and boat work, including risk assessment

- C2 Conduct research both individually and as part of a small group
- C3 Employ a variety of laboratory techniques for Marine Zoology (e.g. microscopy, dissection, behavioural experimentation)
- C4 Collect and analyse field, ecological and boat-based organismal data
- C5 Employ a variety of techniques for morphometric, taxonomic and physiological data

Teaching and Learning Methods

Practical, field and research skills are developed in laboratory, field and boat classes. Students are encouraged to develop and hone their practical skills through tutorial support and supervisor contacts in practical classes and project work. Independent and group project based exercises further reinforce these lessons and allow self-evaluation and critique (C1-C5).

Assessment Strategy

Assessment is primarily based on coursework in the form of written reports, targeted worksheets, computer based exercises and formative assessment and feedback in the laboratory/field/boat.

Transferable/Key Skills

On completing the programme students should be able to demonstrate:

- D1 Written communication in technical and popular science
- D2 Oral and poster presentation skills
- D3 Team work and interpersonal communication
- D4 Computer literacy
- D5 Numeracy and statistical expertise
- D6 Planning, organisation and independent learning
- D7 Awareness of their responsibility to society and the environment, including their potential influence in society
- D8 That they are motivated people, able to build on the learning experiences of the degree programme and the range of learning experiences and initial qualifications they had on entry
- D9 That they are capable of obtaining and developing careers in a wide range of work environments

For students on the Placement Year programme:

- D10 Reflect on and manage own learning and development within the workplace.
- D11 Use existing and new knowledge to enhance personal performance in a workplace environment, evaluate the impact and communicate this process.
- D12 Use graduate skills in a professional manner in a workplace environment, evaluate the impact and communicate the personal development that has taken place.

Teaching and Learning Methods

Key skills (D1 – D6) are taught formally at Stage 1 and developed further at Stage 2. Skills D7 to D9 are developed through participation in a work placement at Stage 2, which allows students to become more independent and work alongside organisations in the marine sector. All skills (D1 – D9) are reinforced to an advanced level at Stage 3 through exposure to practitioners and case studies in seminars and from visiting lecturers. These are an integral part of many advanced modules. Students take part in a variety of problem solving activities, including design of projects, role play exercises and planning overseas travel.

Assessment Strategy

Key skills are assessed by a combination of examination and coursework assignments, including project and practical reports, a reflective log, essays, oral and poster presentations and computer-based assessments.

12 Programme Curriculum, Structure and Features

Basic structure of the programme

- (a) Duration three years.
- (b) Comprises three stages.
- (c) A total of 360 credits, 120 Stage 1, 120 Stage 2, 120 Stage 3
- (d) Module credit values vary between 20 and 40. 20 credits represents 200 hours of student activity and 40 credits 400 hours of student activity.
- (e) Progression: Pass in 120 credits is required in Stages 1 and 2. Modules which are failed with a mark of 35 to 39 can be compensated if the overall mark is 40 or more. The Board of Examiners may pass by discretion if circumstances warrant.
- (f) Innovative features of the degree include the amount and integration of field studies into the programme, the vocational work placement, the overseas field course and the use of external practitioners and case studies to inform Stage 3 teaching. Students undertake two

weeks of residential field courses, one week of local field work and three other modules include practical laboratory, field and research vessel classes.

Stage 1

Stage 1 is an introduction to core subjects in Marine Zoology, supported by a balanced programme of modules designed to provide the sound scientific background required for the later stages of the degree programme.

Five compulsory modules cover the wide variety of ways in which the marine scientist records marine environmental data, how that information is processed and how it is subsequently used. All candidates for the Honours degree in Marine Zoology must demonstrate a high level of proficiency and knowledge of the subject areas covered by all of the listed modules.

The five compulsory modules at Stage 1 introduce the student to key areas of the syllabus and provide an introduction to practical study through the use of field and laboratory classes and work on-board the research vessel. Independent field study with appropriate study guides, video and other methods of learning of Marine Zoology, to ensure that the student has developed the skills required. The courses provide both an overview and an introduction to the subject and the modules are suitable for those proceeding to other scientific disciplines.

One elective optional module will allow students to either continue with the study of the marine environment, within the context of marine microbial and algal systems, or to pursue the study of molecular biological and genetic techniques.

At Stage 1 students will be assigned to Personal Tutors who will guide them in learning how to supplement the formal taught components of the course with private study. Tutorials will provide a small group study environment where the student will be encouraged to practise both study and communication skills prior to proceeding to those modules at Stages 2 and 3 where these skills will be formally assessed.

On completing the Stage 1 programme the student:

- Will be eager to learn more about Marine Zoology
- Should have a sound knowledge of these subjects at an introductory level
- Will understand the basis for the study of Marine Zoology through a combination of organismal biology, natural history and ecology

Stage 2

On completion of Stage 1 every student, whatever their cultural or academic background will have achieved an enhanced basis for more advanced study of the subject at Stage 2 of the Honours Marine Zoology programme which builds on the platform created by the first year of study. A number of compulsory subjects are studied at greater depth and new subjects are introduced. The modules include both pure and applied aspects of the subject material as well as a continuation of basic scientific and information skill related modules.

All students will again take five 20 credit compulsory modules. In addition, students will select one optional 20 credit module. These build directly on learning during Stage 1 and introduce additional concepts that will lead into more advanced modules to be studied in Stage 3 of the degree programme.

Special features of the course are modules providing more detailed coverage of experimental biology, marine ecology, marine vertebrates, molecular biology and animal function, experimental and applied marine biology that lead into the advanced modules to be studied in Stage 3 of the degree programme.

Considerable emphasis is given to the learning of field and laboratory practical techniques and employability skills in the compulsory modules. These modules include laboratory and field study, data analysis, statistics and other numerical methods, alongside a vocational work placement with a provider in the marine sector. Students will be given training in safety issues and will undertake small group scientific investigations on a field course that has traditionally been held on the Isle of Cumbrae to provide them with experience of more diverse marine environments.

There are modules encouraging learning of the theoretical basis of specific subjects areas for which every student will have to study a variety of sources of information. Each student will also study modules that will enhance related practical skills. These modular elements are designed to develop student skills in information technology, data and information source

handling, writing and oral presentation. All of these skills are essential to study at Stage 3, but they will also help facilitate progression to a range of careers following graduations.

On completing the Stage 2 programme the student:

- will have gained a sound knowledge of the biology, physiology and natural history of marine organisms and their relevance to the functional ecology and biodiversity of marine ecosystems,
- should have knowledge of experimental study of the biology and regulatory processes of marine organisms and how this can be applied to address issues such as conservation, marine natural products and biofouling
- will be able to locate and review literature using both library based and electronic information retrieval systems,
- will have developed a variety of practical and field skills appropriate for a Marine Zoologist,
- will be in a position to plan and carry out an independent scientific investigation using either field or laboratory techniques,
- should be capable of independent study including the ability to present a review of their own work or that of others in relation to published sources of literature.
- will be able to recognise their transferable skills and apply them to a range of situations,
- will be aware of career opportunities within the marine sector and have the skills required to be an employable graduate

Building on these skills will be a major part of the programme of study at Stage 3.

Stage 3

Stage 3 of the degree programme has been designed to provide both broad coverage of the subject and to provide opportunities for specialisation and study in depth. The whole programme builds on the diverse learning outcomes achieved in the previous two Stages of the degree programme.

All students will take three compulsory 20 credit module and select one further optional 20 credit module. The 20 credit Advanced modules present a subject in the context of the current research literature and are led by active researchers in the field. The student will complete two Advanced modules and will select to study three specific research topics within each of these modules. Such courses are inevitably specialised and deliberately reflect the research expertise of the School. The Global Marine Science module at Stage 3 will incorporate a small group approach and involve further practical work on-board the research vessel. At this Stage the student will be trained in procedures for study on a research vessel and associated safety measures. Numerical skills may lead into module components involving mathematical modelling and computer simulation in the analysis of marine biological problems. One further aspect of this skills module is the residential overseas field course. This will allow the student the opportunity to further develop their practical field skills, and transfer knowledge gained about the local marine environment to overseas ecosystems. The student will undertake a small group research project that is designed and conducted during the trip and will write this up as an individual report upon their return. This will further prepare them for collaboration and advanced scientific research.

This broad range of advanced course modules forms the background to the student's own independent studies.

A major component of the course that integrates much of the proceeding training is the research project (40 credits).

The main component of the Research Project is an independent scientific investigation that will either be carried out solely in Newcastle under the supervision of an academic within the School, or outside of Newcastle, usually overseas, in partnership with an external organisation or institution. In this instance the student will have an academic supervisor in Newcastle and an external supervisor from their host organisation. Students will present the outputs of their research to the class, stage 2 students and the academic members of the School. The oral component will be assisted by the student having already gained experience at earlier stages of the degree programme and can expect to have achieved a high level of technical and professional competence by this stage of the degree programme.

To further complement their development as research scientists, students will attend seminars delivered by external presenters across the marine sector. These will present

conceptual ideas and provide the basis for in-depth independent study and will often involve interaction with Marine Scientists invited to participate in the programme.

Key features of the programme (including what makes the programme distinctive)

Key features of Marine Zoology are its focus on organismal biology, natural history and physiology. It is distinctive from 'classical' marine biology programmes in that it explicitly provides tailored learning in the fields of organism form and function, taxonomy and molecular biology with less emphasis on applied fields of conservation, management, anthropogenic impact and broad-scale ecology.

Students on the Careers Placement Year programme will take their placement in the penultimate year of studies.
